What is CSS clearfix, how is it used, and why is it helpful?

CSS clearfix is a way to modify and solve an overflow problem images that are put horizontally. When floating your images there might be an issue with it overflowing out of the container you have it in. To solve this issue you can write a new class or name the object in your css file and under style on your html page and write (overflow: auto).

What are SaSS and LESS?

SaSS and LESS are stylesheets SASS stands for Syntacticlly Awesome StyleSheets LESS stands for Leaner CSS. Some key differences between both are that SASS works to stop repetition in code, is an extension of css,its coded in ruby and helps in maintaining code. LESS is used to customiza maintain and manage and reuse stylesheets for websites. Its also written in javascript and keeps everything reable and manageable.

What is your favorite thing you learned this week?

My favorite thing I learned this week was that to add the same style to multiple items theres an easier way to do it then using css in html. Finding out that I can hover over items that could change color is really interesting to me. I was wanting to know more about how to animate images.
